Monitoring of life quality indicators in the countries of the Commonwealth of Independent States 2019-2022.

Interstate Statistical Committee of the Commonwealth of Independent States / – M. 2023. – 97p.

Interstate Statistical Committee of the CIS was formed in 1992 in accordance with the Agreement on statistical service of the Commonwealth of Independent States and pursuant to the decision of the Heads of Governments of the CIS member states of 30 December, 1991.

Based on the UN General Assembly Resolution A/RES/48/237 of 30.03.1994, which granted the Commonwealth of Independent States an observer status under it, the CIS Statcommittee participates in the work of the UN Statistical Commission, UNECE Conference of European Statisticians and its Bureau, ESCAP Committee on Statistics, is a member of the Committee for Coordination of Statistical Activities, which consists of more than forty international statistical organizations.

Having the status of international statistical organization and relevant authorization from the Council of Heads of Statistical Services of the CIS Countries, the CIS Statcommittee has ample opportunities to support the interests of the national statistical services of the region in various international projects.

* * *

The abstract presents the main indicators on the living conditions of the population. The publication is intended for social policy specialists, demography, economists, statisticians, businessmen and the media.

Data for Turkmenistan and Ukraine are provided from the official websites of the national statistical services of these states. Since 2022, CIS-Stat does not have official data on Ukraine.

In some cases a slight discrepancy between the totals and the sum of items are explained by data rounding up.

Data for 2022 for some indicators are preliminary and can be revised later.

PREFACE

CIS-Stat provides statistical information on life quality in the CIS countries through some indicators. The publication was prepared pursuant to the Action Plan for the implementation of the first stage (2021-2025) the CIS Economic Development Strategy for the period up to 2030, approved by the Decision of the Council of Heads of Government of the Commonwealth of Independent States.

The frame basis of this publication is the "List of statistical indicators of the general well-being of people and their living conditions". This system of indicators was proposed by a group of experts on the development of life quality standards, created by the decision of the Advisory Council on Labour, Employment and Social Protection of the Population of the CIS member states. It included representatives of interested ministries and departments of the CIS member states and CIS-Stat.

The publication includes indicators on the population well-being, the situation on the labour market, social protection, health, education, housing conditions of the population, environmental situation, legal protection, culture and leisure.

Some indicators presented in the statistical abstract can be used to monitor progress in achieving the Sustainable Development Goals (UN General Assembly Resolution 70/1 of 25 September 2015, "Transforming our world: the 2030 Agenda for Sustainable Development"). These goals (SDGs), which replaced the Millennium Development Goals (MDGs), are aimed at meeting the needs of the population of developed and developing countries. The Agenda for Sustainable Development, signed by all UN member States, came into force on January 1, 2016. It includes three components of sustainable development: the social, the economic and the environmental, contains 17 goals and 169 targets.

The UN Statistical Commission approved the list of sustainable development indicators at its 47th session in March 2016. This list was proposed by the Inter-Agency and Expert Groups as a starting point for further technical improvement.

LIFE QUALITY STANDARDS

Life quality standards were developed in pursuance of the Action Plan for the implementation of the CIS Economic Development Strategy for the period up to 2020. They were approved by the decision of the CIS Economic Council dated December 2, 2021.

In accordance with this decision, the CIS-Stat was asked to take into account the information and reference materials on the implementation of the Life Quality Standards by the CIS member states while preparing this publication.

The Life quality standard is a level supported by CIS member States at a sufficiently high level. This level ensures that the needs of the population are met in accordance with the economic opportunities of CIS member States.

The purpose of Life quality standards formation is to establish a minimum level of state guarantees and determine the benchmark for the implementation of the socio-economic policy of the state and ensure its sustainable development.

For a general assessment of the situation of the CIS member states, the List of Statistical Indicators of the general welfare of people and their living conditions is used. In accordance with this list, the Life quality standards define key indicators of the general welfare of people and their living conditions.

1. WELFARE

Gross Domestic Product (GDP) is the key indicator of SNA which describes the functioning of the economy as a whole and characterises final results of production activities of economic units - residents. It represents the value of final goods and services produced by these units during the accounting period in prices of final purchasers. The average annual population of the state is used to calculate GDP per capita.

Purchasing power parity (PPP) is a ratio between currencies that takes into account the price levels in respective economies; it is computed by equalizing the values of a basket of goods and services calculated in prices and currencies of economies being compared.

Average monthly nominal wage is calculated by dividing the accrued wage fund by the period average number of payroll employees; received figure is divided by the number of months in the period. The data on gross remuneration are given including arrears, taxes and other deductions according to national legislation.

Minimum wage – the minimum wage amount to all employees, which is set by the state for a certain period of time (by the appropriate decree of the President or resolution of the Government).

Real wage index is calculated by dividing the nominal wage index by consumer price index for the same period of time.

Coefficient of funds (coefficient of income differentiation) characterizes the degree of social stratification and is defined as the ratio between average levels of money income of 10% groups of population with the highest incomes and 10% groups of population with the lowest incomes.

Quintile coefficient of income differentiation characterizes the degree of social stratification and is defined as the ratio between average levels of money income of 20% groups of population with the highest incomes and 20% groups of population with the lowest incomes.

Gini coefficient (index of income concentration) shows the unequal distribution of income of population. Gini coefficient can range between 0 and 1, with the higher value of the index, the more unequally distributed incomes. Theoretically, the extreme values correspond to a situation where the entire population receives the same income (Gini coefficient = 0), or when one person receives all the income (Gini coefficient = 1).

Proportion of population living below the national poverty line is determined on the basis of data on population distribution by average per capita money income (expenditure) and is the result of their measurement with the value of subsistence minimum (poverty line) established for each of the Commonwealth countries in accordance with national legislation (SDG indicator).

Equivalence scale is a set of weight coefficients for converting the total number of household members into the number of equivalent consumers, which allows us to take into account the impact of differences in the size and composition of households on the level of consumption and remodel the income (consumer spending) of different composition households to a comparable form.

Employment rate – the ratio of the employed population of a certain age group to the population of the corresponding age group.

Unemployment rate (according to the ILO methodology) is determined as the ratio of the number of unemployed to the number of labour force of the corresponding age group. According to ILO recommendations these are the persons at the age set for measuring the economic activity of the population without job during the reference period of time, were searching for work with the help of employment services or on their own and were available to start work immediately, or during a certain period (SDG indicator).

Registered unemployment rate is defined as the ratio of the number of unemployed persons registered at employment offices to the number of labour force.

Youth unemployment rate (according to the ILO methodology) is the ratio of the number of unemployed persons aged 15 to 24 years to the total number of labour force of the same age group (SDG indicator).

Long-term unemployment – the ratio of the number of unemployed people whose period of stay in the state of job search (unemployment) is 12 months or more to the total number of unemployed.

¹ Coefficient of funds (coefficient of income differentiation) characterizes the degree of social stratification and is defined as a ratio between average levels of money income of 10 % groups of population with the highest income and 10 % groups of population with the lowest income.

² Gini coefficient (index of income concentration) shows the unequal distribution of income of population. Gini coefficient can range between 0 and 1, with the higher value of the index, the more unequally distributed incomes. Theoretically, the extreme values correspond to a situation where the entire population receives the same income (Gini coefficient = 0), or when one person receives all the income (Gini coefficient = 1).

**Indicators of differentiation of population by level of income

Tajikistan	26,3
Turkmenistan
Uzbekistan	11,0	11,5	17,0 ³	14,1
Ukraine ^{2,4}	41,3	47,2	39,1	...

¹ Calculated on basis of the current distribution of population by the value of per capita money income (Russia), available resources, including the cost of natural income (Belarus), expenditures used for consumption (Azerbaijan, Armenia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan and Uzbekistan), total expenditure (Ukraine). The use of different methodological approaches to calculation of poverty level indicator makes it impossible to make comparisons between countries.

² The indicators are calculated using national equivalence scales to assess the effect of cohabitation in a household.

³ Here and further: in Armenia (2019), Moldova (2019), Russia (2021) and Uzbekistan (2021) the methodology for calculating the poverty level has been changed.

⁴ Proportion of population with per capita equivalent total expenditures below the actual subsistence minimum

¹ Ratio of the number of unemployed persons who have been looking for a job for 12 months or more to the total number of unemployed persons.

2. SOCIAL PROTECTION OF POPULATION

Labour old-age pension is calculated as ratio of total amount of assigned old-age pensions to pensioners registered in social security organizations to number of old-age pensioners.

Social pension is amount of payment to disabled children, disabled people and the elderly if they do not have the right to a labour pension.

Minimum old-age pension is minimum amount which is guaranteed to population by pension legislation.

Consolidated budget – combines the republican (federal) and territorial budgets, including regional and local budgets.

The publication presents data on Azerbaijan – the state budget (including data on the budget of the central government, regional and local budgets, excluding data of public fund), since 2019 taking into account receipts of the Guarantee Fund of public debt and guarantee obligations, Armenia – the state budget (do not include data on revenues and expenditures of municipal budgets), for Moldova – including public funds of social insurance and obligatory medical insurance, for Russia – including public extra budgetary funds, for Tajikistan – taking into account all sources of financing, Uzbekistan – state budget, for Ukraine – including public purpose funds.

Budget expenditure (consolidated) includes the expenditures of the general government bodies for general administration, defense, health care, education, development of market infrastructure and so forth. Also is included the lending (minus the repayment), provided by the government to other sectors of economy or to the rest of the world. The expenditure of the consolidated budget includes outlays of all respective levels of the general government – republican (federal), regional and local.

Expenditure on social protection – includes expenditure for public pensions, social services and social security of the population, the fight against homelessness, custody, guardianship, research and development in the field of social policy, etc.

Expenditure on health – includes the expenditure on medical products, appliances and equipment, outpatient, hospital services and emergency care, health and recreational assistance, sanitary and epidemiological well-being, functioning blood banks, research and development in healthcare.

Expenditure on education – includes the expenditure on pre-school, primary, secondary and higher education, education is not divided by stages, training, retraining and advanced training, research and development in the field of education.

Expenditure on recreation, culture and religion – includes the expenditure on recreation and sports, cultural services, television and radio, periodicals and publishers, services related to religion, research and development in recreation, culture and religion.

3. POPULATION AND HEALTH

Life expectancy at birth is a mean number of years to be survived by an individual of generation born, given the mortality conditions remain the same as in a given period.

Total fertility rate is the average number of children that would be born alive by a woman during her lifetime if she was to pass through all childbearing years conforming to the age-specific fertility rates of a given year. Evaluates the birth rate for ensuring population reproduction when comparing it with the threshold value corresponding to the level of simple population reproduction (2,1).

Age dependency ratio is calculated in relation to the population aged 15 to 65 years:

- number of children under 15 years of age;
- number of elderly people aged 65 years and older;
- total number of children and the elderly.

Marriage rate - is calculated as the number of registered marriages in a year divided by the mid-year population. It is frequently expressed as marriages per 1,000 persons.

Divorce rate - is calculated as the number of registered divorces in a year divided by the mid-year population. It is frequently expressed as divorces per 1,000 population.

Infant mortality rate is ratio of the number of deaths under one year of age to the number of live births. It is calculated per 1,000 live births.

Mortality rate of children under the age of 5 years determines the probability of death of a child between the ages of birth and 5 years. It is calculated per 1,000 live births (SDG indicator).

Maternal mortality rate is the ratio of the number of deaths of women due to pregnancy, childbirth and in the postpartum period (within 6 weeks after birth) per 100,000 live births (SDG indicator).

Morbidity of population by main groups of diseases is defined as the number of newly registered cases per 100,000 population.

Occupational injuries is defined by the ratio of the number of people injured at work per 10,000 employees (SDG indicator).

Newly registered adult persons with disability is defined as the number of persons aged 18 (16) years and older who were first recognized as disabled in the reporting year, per 10,000 population of the corresponding age.

Disability means health problems with a persistent disorder of organism function that control life and the need for social protection.

Mortality rate is the number of deaths by cause class and by specific cause per 100,000 population.

² Living area.

³ According to the data of local self-government bodies; not for the full range of owners of dwelling stock.

⁴ 2018.

⁵ Total dwelling stock.

6. QUALITY OF GOODS AND SERVICES

Consumer expenditure refers to expenditure of households on purchases of foodstuffs, non-food products and alcoholic beverages as well as on consumer services

Consumer price index (CPI) characterize changes of the general price level of goods and services purchased by the population for non-productive consumption over the time period. The CPI measures the ratio of the cost of a fixed basket of goods and services at prices of the current period to its value in the prices of the previous (baseline) period, and does not account for changes in consumption patterns of the population. Calculated by the Laspeyres formula on the basis of individual indices of consumer prices and tariffs for goods and services. Source of information for the calculation of the individual indices of consumer prices is the monthly registration of prices and tariffs of commodities-representative.

The structure of actual consumer spending in base period, based on households budget surveys, is used as weight for calculation of the consumer price index.

Classification of Individual Consumption by Purpose (COICOP) is used for calculating the consumer price index. CPI can be calculated in accordance with the groupings provided COICOP and other groups, based on the needs of users.

The share of population of each country in the total population of the Commonwealth is used as weights for calculating of the consumer price index for CIS total.

Provision of population by public transport is characterized by the number of passenger trips per person per type of public transport (railway, bus, taxi passenger, tram, trolleybus, air, metro).

Provision of population by cars is characterized by the number of owned vehicles that are used by citizens (based on vehicle registration statistics) calculated for 1000 population.

Number of subscribers to mobile network is characterized by the number of users of cell phones who are subscribers of service of the public mobile telecommunication providing access to a public telephone network on the basis of cellular technology. Calculated per 100 population.

Provision of population by home fixed telephone is characterized by the number of main and additional telephone sets installed in apartments, in their own houses. Calculated per 100 population.

6.1. Consumer goods and services

7. ENVIRONMENTAL SITUATION

Emissions of pollutants into the atmospheric air from stationary sources is the total quantity of all pollutants emitted into the air by sources of pollution after the process of neutralization with the help of gas cleaning installations that did not result in complete neutralization and cleaning as well as without neutralization.

Forest – land spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of more than 10 percent, or trees able to reach these thresholds. It does not include land that is predominantly under agricultural or urban land use (FAO).

Forest area is given as a percentage of the total area of the country (SDG indicator).

Household water use – amount of water used to realization the household and drinking needs of population.

Emissions of pollutants into atmospheric air
